GROUP 2 / GC2 BUSINESS SUMMARY

Revenue that supports trust

ToneVault is a marketplace prototype for premium pre-owned and vintage guitars. Member 4 added two GC1 revenue features that are simple to explain, calculated by the server, and saved with each order.

What we built

The server reads the current catalog price, ignores any total typed by the browser, and calculates with integer centavos. The database checks the price and stock again, then saves the order and reduces stock in one transaction. Each saved order keeps its own price, rate, fee, payout, platform revenue, and total.

REVENUE FEATURE 1

8% marketplace commission

Rule: ToneVault keeps 8% of the guitar subtotal from the seller.

Business value: Revenue grows when ToneVault helps complete more and higher-value sales.

Limit: The buyer still pays the listed guitar price when no add-on is chosen.

REVENUE FEATURE 2

Optional verification add-on

Rule: None: ₱0 / Remote: ₱2,800 / Physical: ₱8,500, added once per order.

Business value: Monetizes ToneVault's trust service while directly supporting the value proposition.

Limit: Optional by design; not every buyer needs another inspection.

How pricing travels

1. Browser sends product, quantity, option
2. Server reads catalog price
3. Shared rules calculate the breakdown
4. Database validates, saves, updates stock

Why this supports GC1

- Commission aligns ToneVault's income with successful marketplace activity.
- Verification earns revenue from the trust service that differentiates ToneVault.
- Server-owned pricing prevents a browser from lowering the saved total.

GC2 scope: simulated payment only.

WORKED NUMBERS AND EVIDENCE

What the rules produce

These examples separate what the buyer pays, what the seller receives, and what ToneVault records. The automated results matched every expected value.

Commission example

PRS Custom 24 / ₱168,000 / no add-on

Buyer total: ₱168,000

Commission: 8%: ₱13,440

Seller payout: ₱154,560

ToneVault revenue: ₱13,440

Conclusion: revenue is tied to a recorded marketplace sale.

Verification example

Gibson ES-335 / ₱195,000 / physical

Buyer total: ₱203,500

Commission: 8%: ₱15,600

Seller payout: ₱179,400

ToneVault revenue: ₱24,100

Conclusion: physical verification adds ₱8,500 while supporting buyer trust.

Implementation evidence

Single source:

One active rules file owns 8%, ₱2,800, and ₱8,500.

Server quote:

Returns unit price, subtotal, fee, commission, payout, platform revenue, and total.

Saved snapshot:

The migration records the breakdown and keeps historical orders unchanged.

Verification:

17 tests passed; typecheck, changed-file lint, and production build passed.

Live read-only check:

A supplied total of 1 was ignored; the catalog price produced the result.

Limits and next integration decision

- Payment is simulated. Saved amounts are projected revenue, not cash received.
- The migration is not applied to the shared database and the pricing PRs are unmerged.
- Deployed Postman evidence, human review, and Member 4's own Challenge 5 recording remain separate requirements.

Bottom line:

Commission monetizes completed sales; optional verification monetizes trust. Both are transparent, server-calculated, and saved for later reporting.
